Although we have never competed at the International SeaPerch Challenge and this is our first time participating in the SeaPerch program, during this season, we have built an ROV that can maneuver swiftly and accurately through obstacles, along with a hook that will be able to pick up items in real life, and a net to capture potential sea-life to study it. Moving forward, our Seaperch is unique because the ROV has an arm that will be able to pick up materials, a net that can carry items, and it is a smaller ROV, which makes it faster and quicker to move through. Last but not least, our biggest takeaway from this season is to never give up, there are going to be many obstacles on the way to success, and taking care of marine life is important to life on Earth.
